Create a github repository where you will upload your code and your cleaned data.

1. Download news data from any websites for a given keyword:
   • The outcome should be a dataframe
   • Apply your function to at least 3 page
   • Write function, use lapply and rbindlist

2. Choose a task from the excel
   • Find a website, analyze the data source F12 network tab
   • Find a json data source of the website, and make the POST or GET request
   • Write a function that return with the processed data
   • Save it, with saverds

3. Use selenium and click on the next page icon (optional)
   • Open a chrome browser with selenium
   • Navigate to page
   • List items and click on the next page icon
   • In every page download the source code of the page and save it as an html format

Deadline is 4 December
